ALPHABETICAL GUILLOCHE PATTERNS

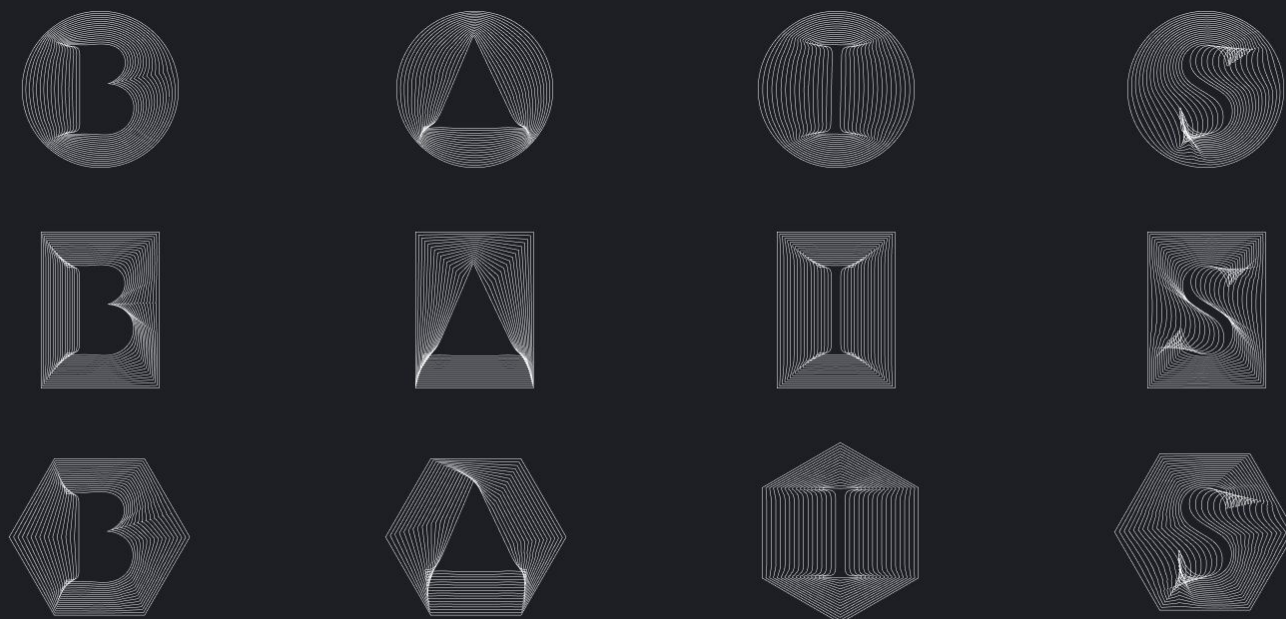

Overview

I will try to explain how we can make alphabetical guilloche patterns using simple rotation and displacement techniques. As a designer with some knowledge in CSS I will link to CSS properties. Also I will demonstrate the basic principles of creation, based on Adobe Illustrator tools. I added only a few letters and shapes to the graphic resources. First of all we should check if it works with my approach or we should find another way to export.

BACKGROUND GUILLOCHE PATTERNS. ROTATION

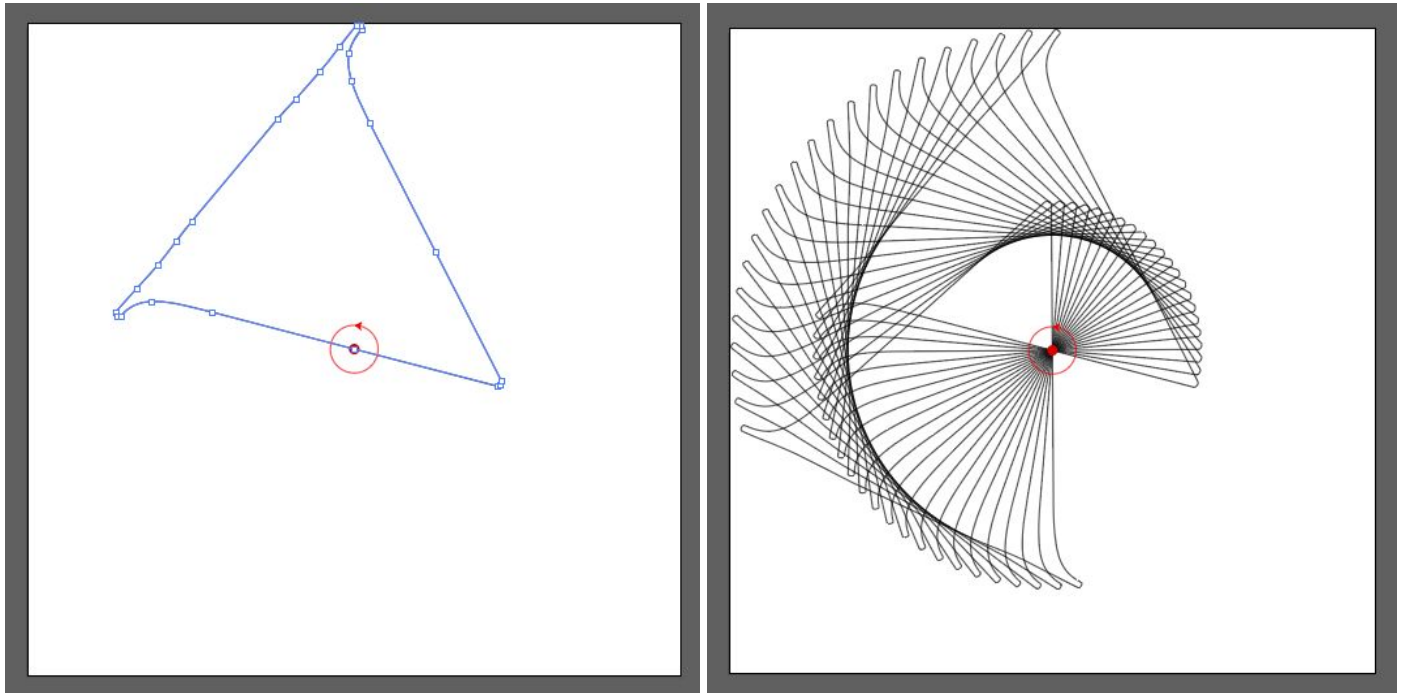

FROM LETTER TO SHAPE. PATH TO

Background guilloche patterns. *Rotation*

Link to assets -> ["Rotation" Assets](#)

To get the desired result we must rotate our letter around any point lying on the Bezier spline. We can probably do this programmatically but some characters are too complex. Because of this I prepared a .svg pack where each character has the right shape and location for **central** rotation. The image below shows you the basic principle

I was able to repeat the right rotation effect in CSS using my .svg and following properties. The stroke-width is dynamic and I think it will be very useful. Rotation angle should be 5 degrees.

```
.cls-1 {  
  fill: none;  
  stroke: ■ #000;  
  stroke-miterlimit: 10;  
  stroke-width: 0.5px;  
  transform-origin: center;  
}
```

A_Rotation0.svg:1

From letter to shape. *Blend tool*

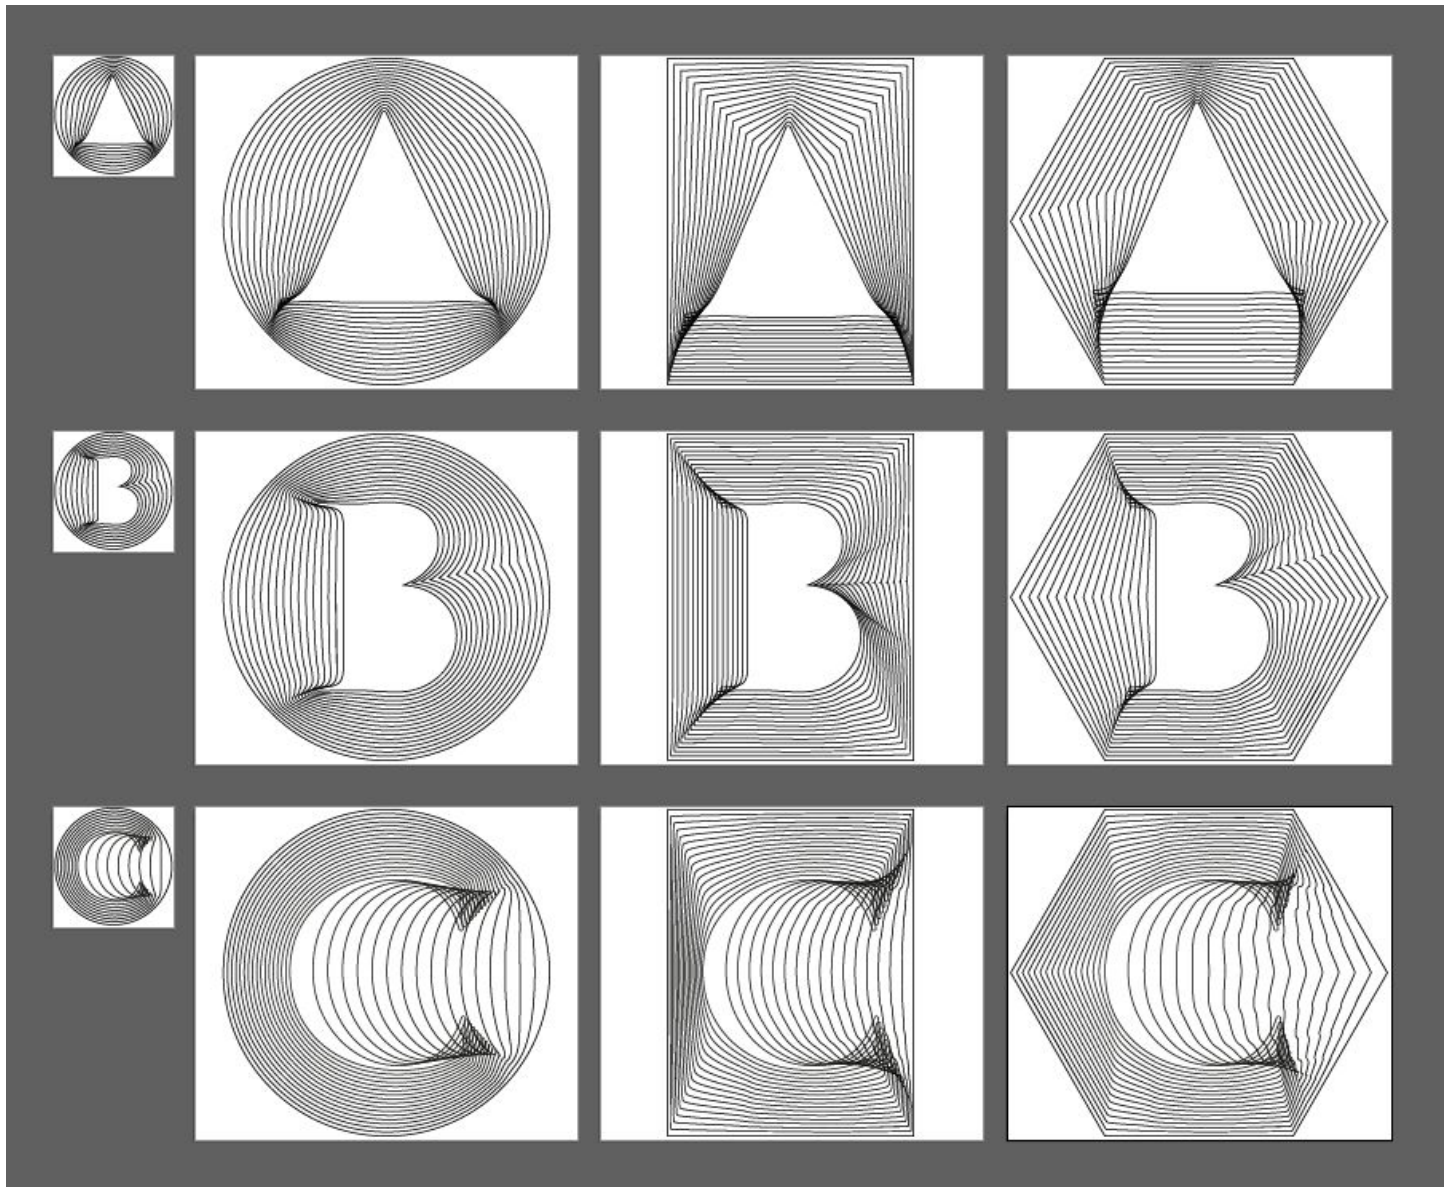

Link to assets (3 letters for test) -> ["Path to" Assets](#)

Link to .Ai file -> [Ai File](#)

With the “Blend” tool in Adobe Illustrator we are able to make amazing shapes like these below. The basic principle of this tool is the creation of additional forms from one to another through the transition. We will have 26 letters and 3 type of shapes (circle, square, polygon). I think we can add more shapes after the first App release.

We have two use cases:

1. **Recommended Section.** In this case we have only one type of shape and 7 transition lines.
2. **Cards.** In this case we have three types of shapes (circle, square, polygon) and 15 transition lines.

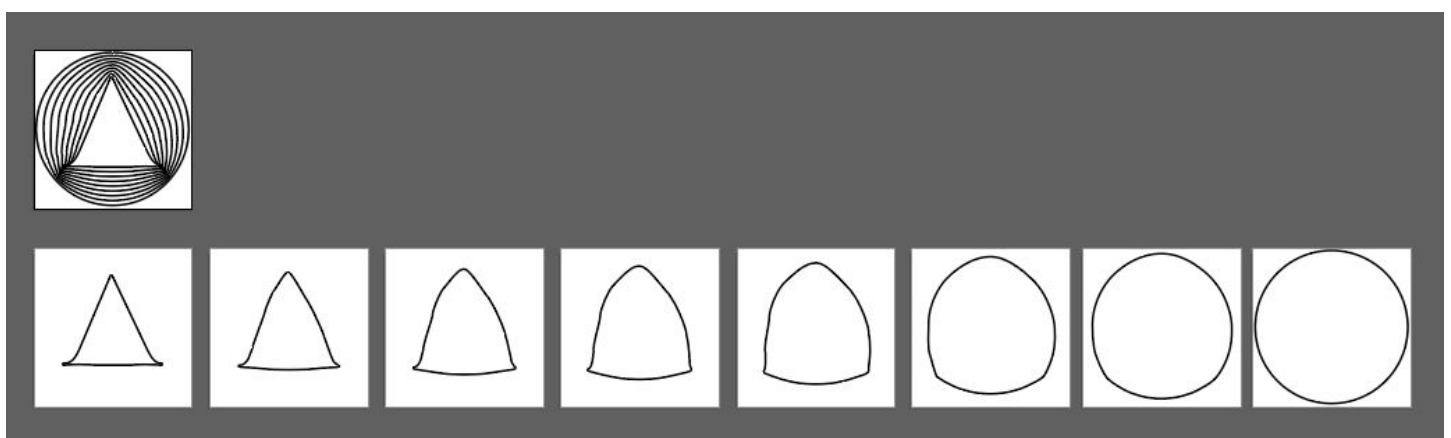

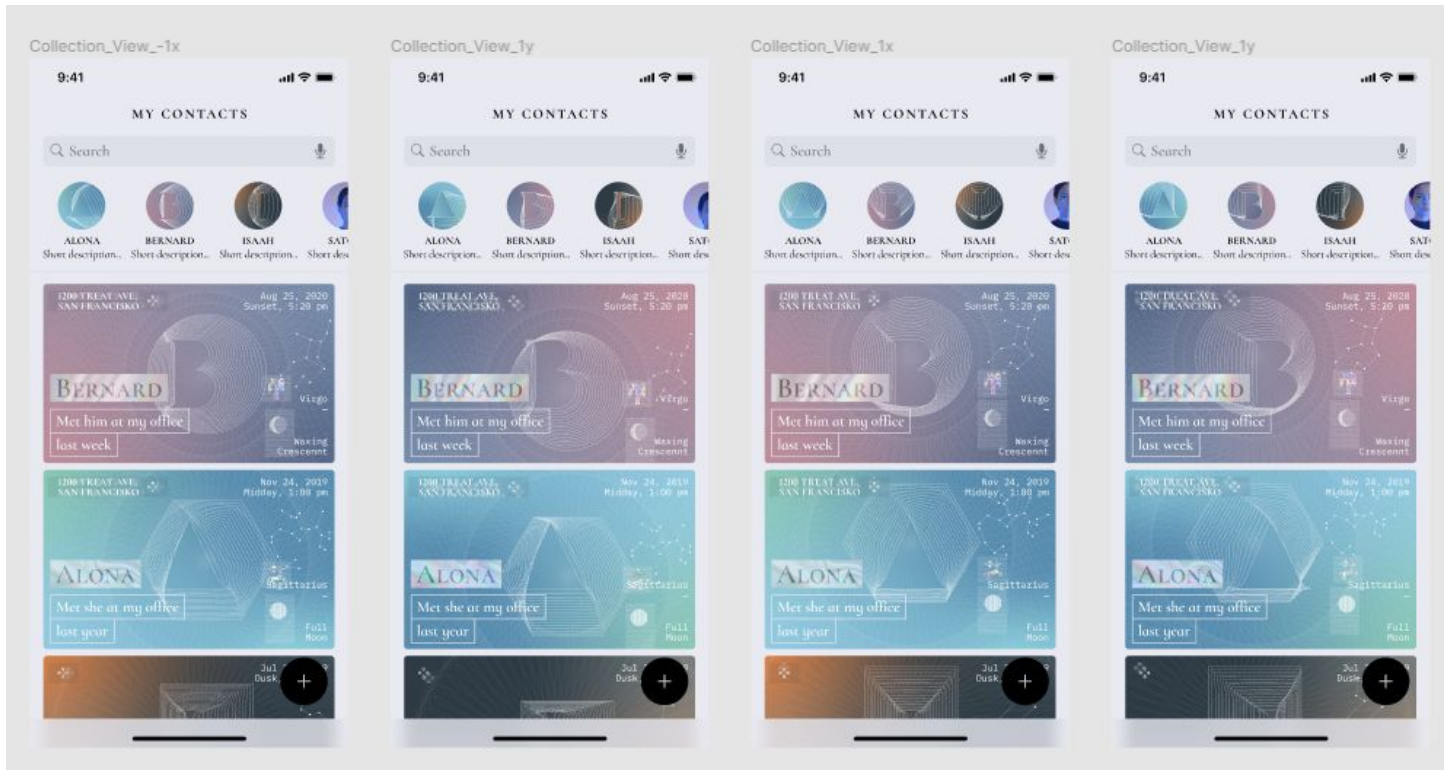

How to get the “deep dive effect”

I exported each line as a separate layer with the same artboard size. All you have to do is put one layer on top of another and move each layer using only two coordinates (x,y).

Layer names in the “Path to” folder:

1. A_C_0 - Letter “A”
2. A_C_0 - Shape “Circle”
3. A_C_0 - Position/Spline “0”

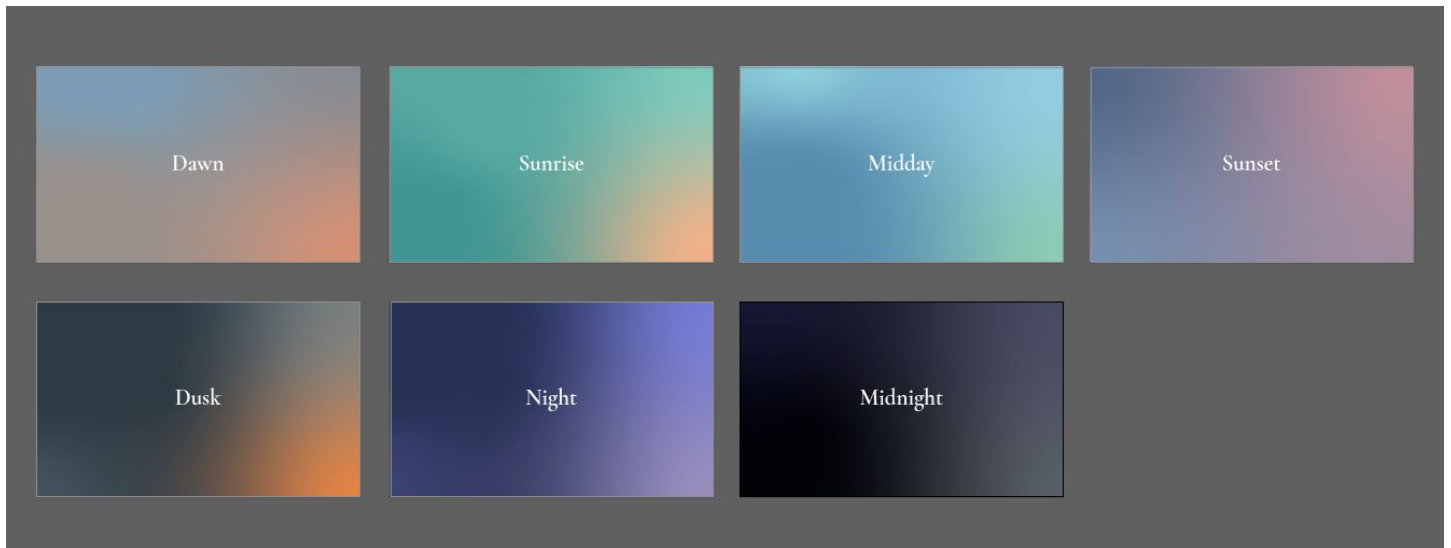

GRADIENTS

Link to assets -> [Gradients](#)

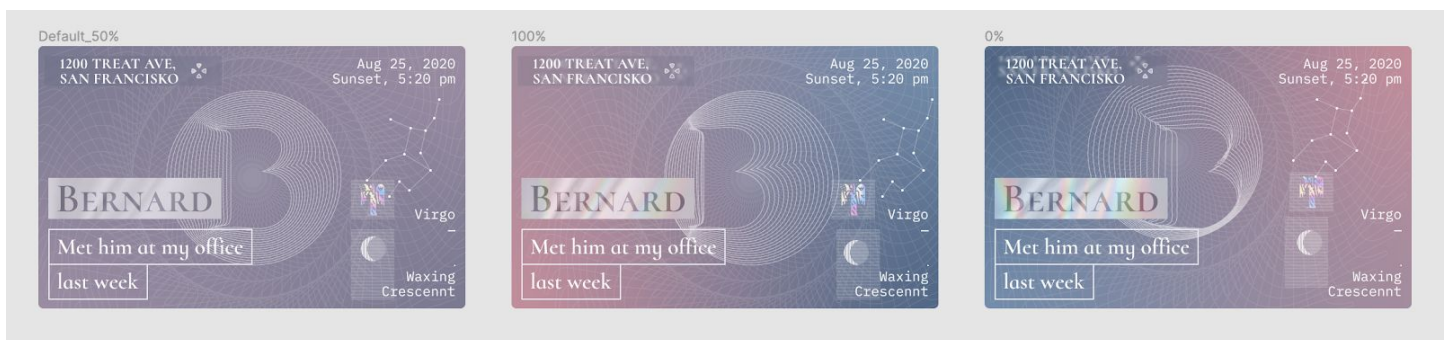

Background gradients

Seven different Background Gradients: Dawn, Sunrise, Midday, Sunset, Dusk, Night, Midnight. Each gradient has enough contrast with white text on it.

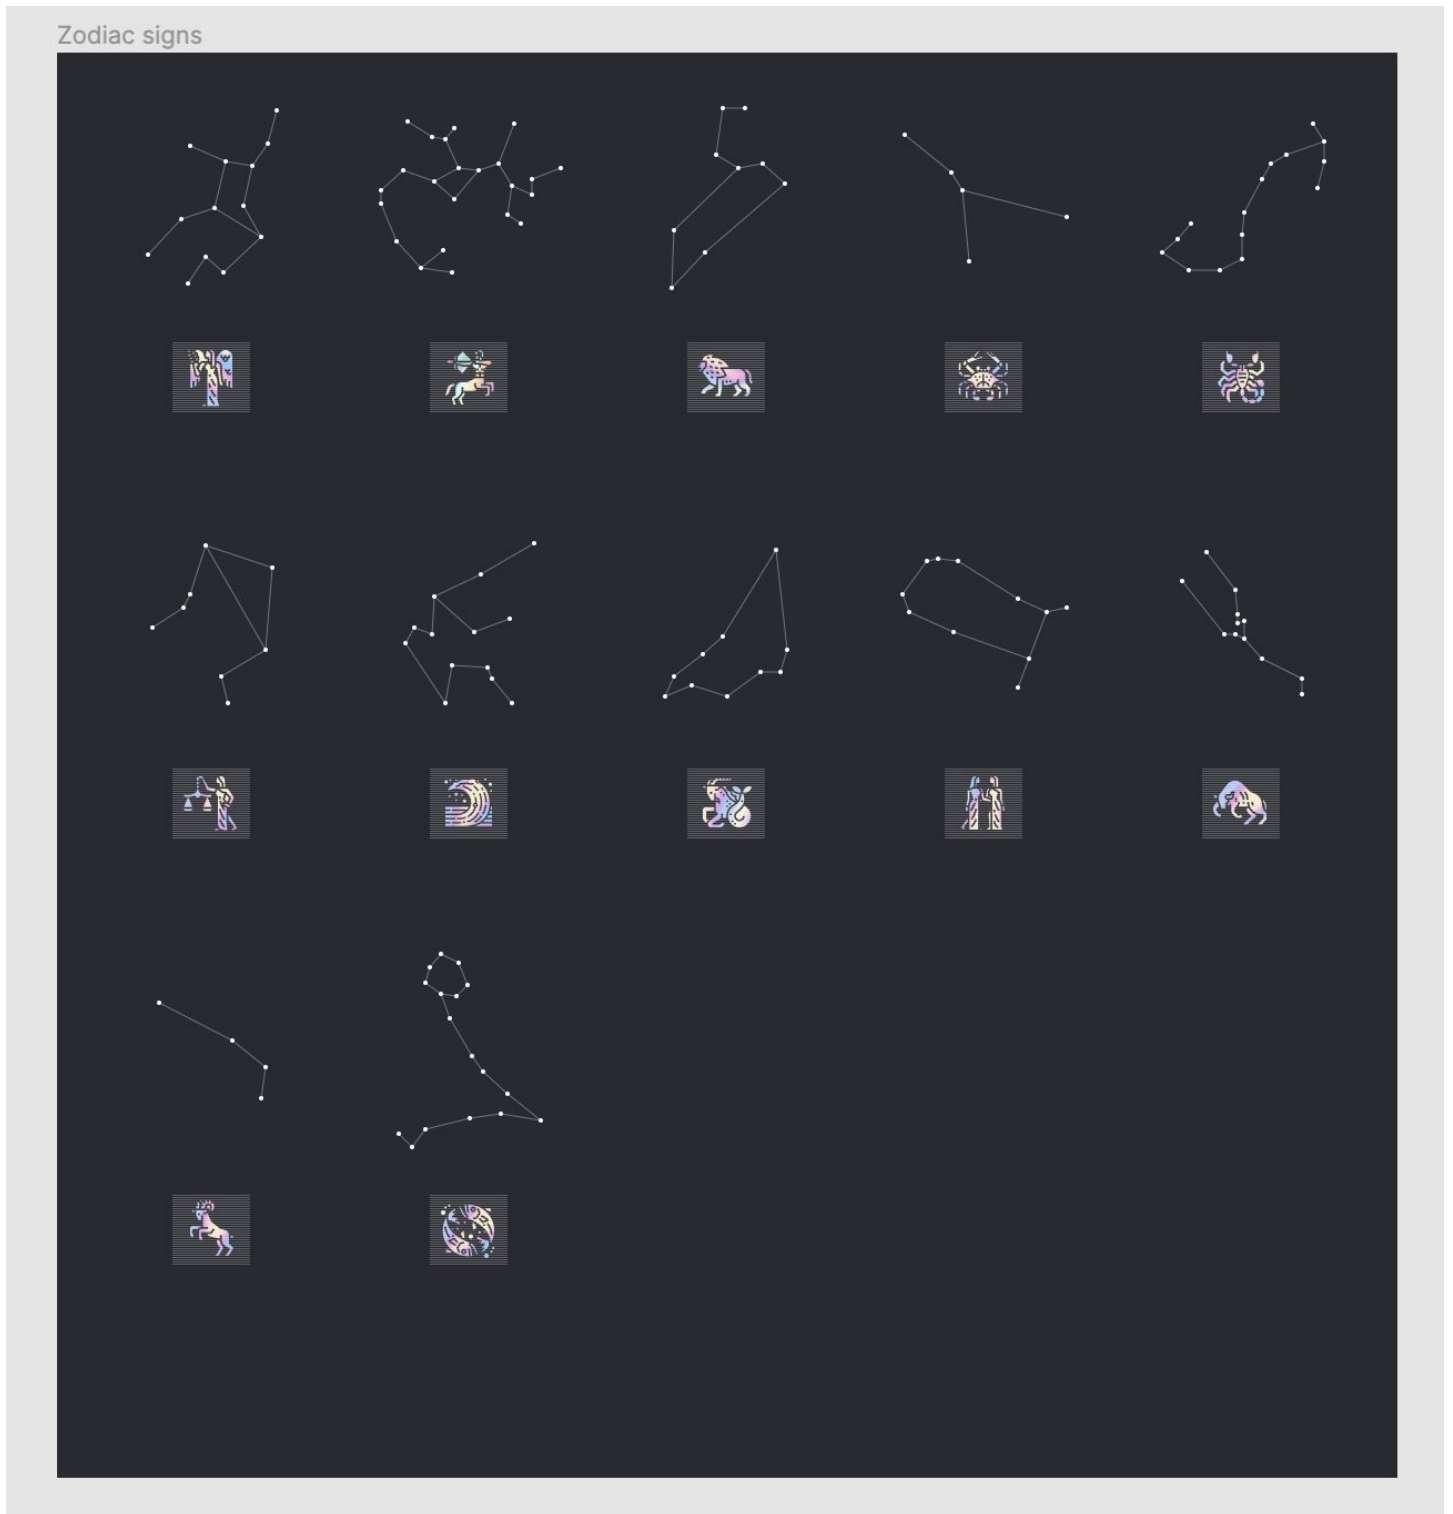

Transfusion

Transfusion through transparency. We should take two identical gradients and change the opacity of the top gradient from 0 to 100% depending on the gyroscope position.

ZODIAC SIGNS

Link to assets -> [Zodiac signs](#)

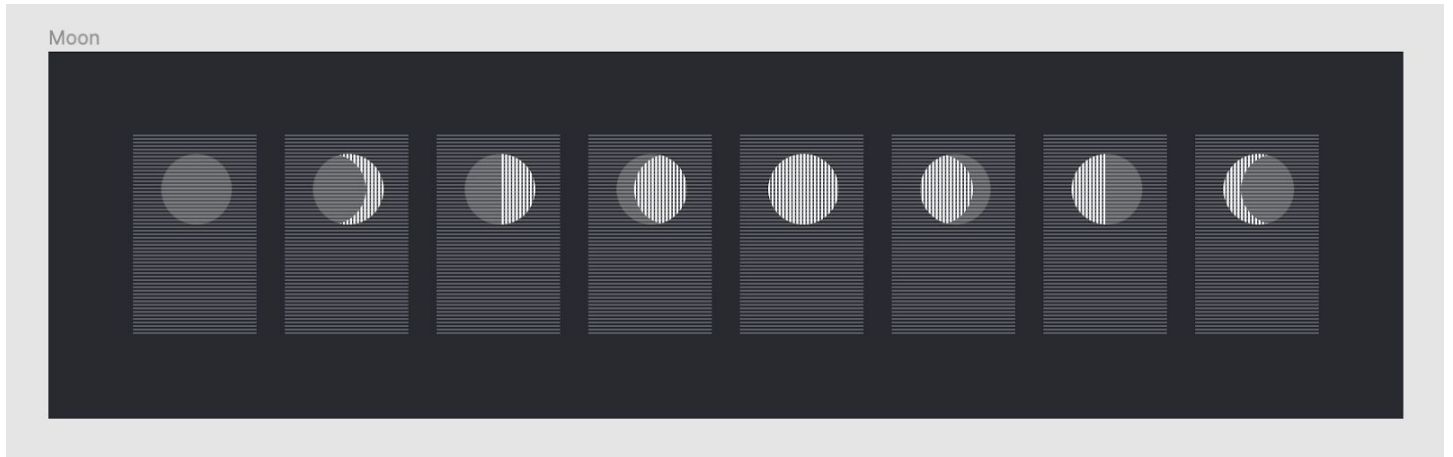

MOON PHASES

Link to assets -> [Moon Phases](#)

Moon Phases

There are eight phases of the Moon: new moon, waxing crescent, first quarter, waxing gibbous, full moon, waning gibbous, third quarter, waning crescent.

HOLOGRAMS & PHOTO COLOR MODELS

Link to specs -> [Animation on the Figma](#)

Holograms

There are 3 objects into the card with hologram effect: Title/Name, Location, Zodiac sign. I used the simplest ways (rotation + different color blending models) to achieve the effect of transfusion, but maybe you can find more efficient ways.

Title/Name

You have to use two layers: bottom layer with (*lighten* blend mode), top layer with (*luminosity* blend mode). Transfusion occurs due to the movement of the bottom along the x,y axis and the rotation of the top.

Location

In the example, you can see that the bottom layer has a blur and moves along the x,y axes depending on the horoscope.

Zodiac sign

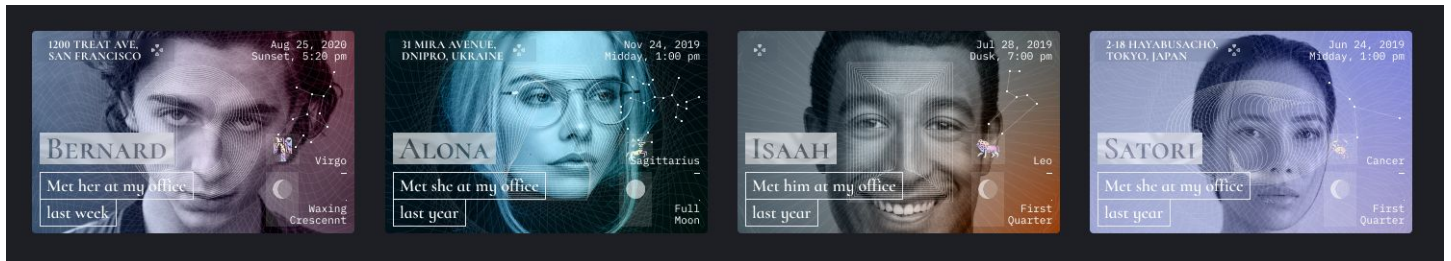

Just moving hologram image along x,y axes

Photo

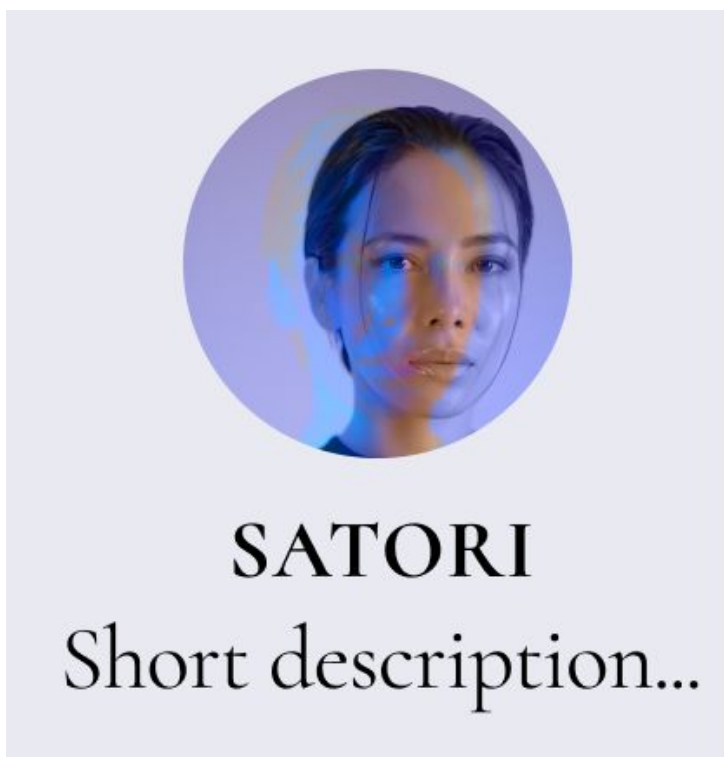

Collection View list

All Photos into cards have *luminosity* blend mode with transparency. I have not found the desired transparency value for the photo yet, but I think we should use range between 45% to 75%.

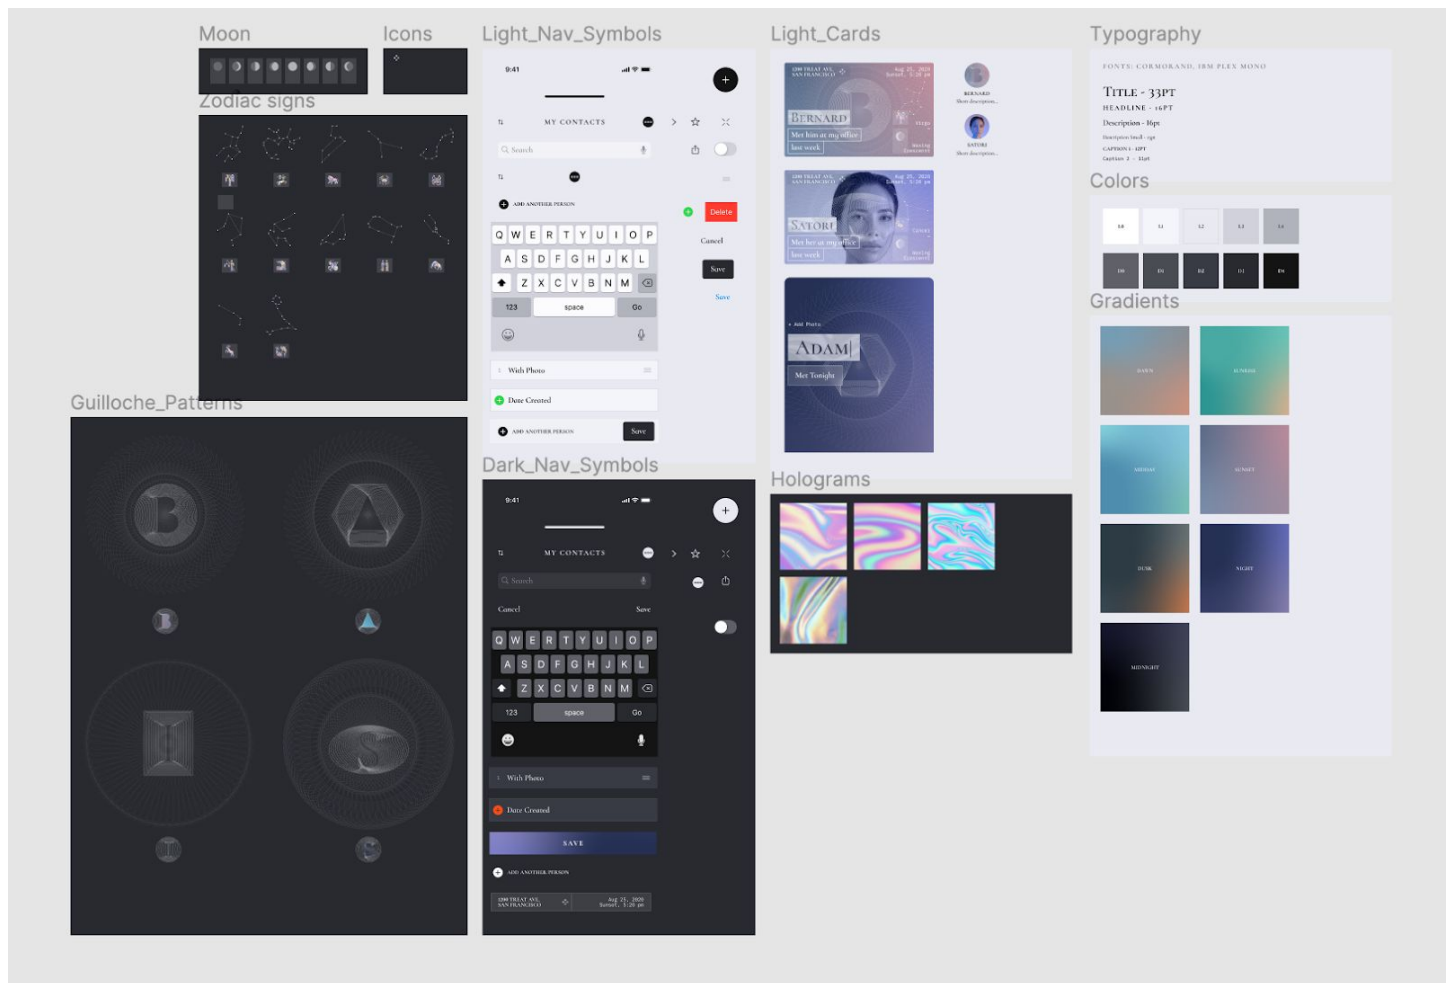

Recommended section

We replace guilloche patterns with photos if the user added a photo. So, to achieve a glitch effect we have to use one photo with *luminosity* blend mode and the same photo on top with *color* blend mode.

STYLE GUIDE & UI KIT

Link to specs -> [Components](#)

APP ICON

Link to assets -> [App Icon](#)

App Icon

We have two types of icons, for small and large resolutions. While I was testing them, I realized that icons less than 60px have to be filled for face recognition.
